JVC Professional Europe announces a 17-inch LCD TFT, the LM-H171 monitor designed specifically for "round the clock" surveillance and monitoring markets.

You can adjust the non-glare viewing panel with the touch of a button. For the preferred viewing of a security operator, the four selectable picture display modes are standard, dark, enhanced, vivid and dynamic. The screen also has a very fast response time of 5ms and comes with a contrast ratio of 1000:1.

The monitor accepts video, VGA, DVI input signals, and with the selectable scan size mode option the LM-H171 optimizes the camera signal input for monitor viewing.

An energy saving feature is included: when no signal is detected, a power save mode reduces the brightness of the LCD backlight.

Available now, the LM-H171 is made from fire retardant material including a metal rear cabinet and connector protection structure, with built-in power supply and optional rack mount adaptor for monitor wall viewing.
