Panasonic launches its 30 series plasma display range, its 20 series replacement with 42", 50", 60" and 65" 3D-ready models designed for home cinema applications.

The series comes with x2 variants-- PF and PH models.

PF30 models are 3D-ready, with dual-HD-SDI and DVI-D boards allowing simultaneous 3D inputs. All models have 5000000:1 contrast ratios, high luminous efficiency and a wide viewing angle.

They come with "Slot 2.0" function slots allowing the support of various digital interfaces.

Meanwhile PH30 models are designed for your more energy-conscious customers, with lower power consumptions than previous models. Panasonic says its 42" and 50" models consumes 30% less energy than their 20 series predecessors.

Each display is part of the Offset for Life initiative, Panasonic's non-profit programme allowing customers to offset the carbon their displays emit.
