Crestron launches an addition to its V-Panel range with the V24-C, combining full touch screen navigation, high performance graphics, HD video and DigitalMedia 8 connectivity in a 24" display.

It connects to Crestron's DGE-2 digital graphics engine, providing access to all digital media your customers want (with HDCP support) and internet access, without needing a separate computer.

Image-wise it features S-PVA technology, for rich colours, black depth and contrast, with ultra-wide 178 degree horizontal and vertical viewing angles.

Navigation is gesture-based, with colourful 3D icons and on-screen keyboard and mouse capabilities. Users can even connect a physical keyboard and mouse via built-in USB port.

One can hide the DGE-2 graphics engine (and related AV source wiring) up to 100m away in the main equipment rack, while DM input allows signal transmission over single CAT5e or DM 8G cable.
