Toshiba will demonstrate its latest TVs at IFA 2011-- now carrying its multi-processor platform, the Cevo Engine.

The company says each of the Cevo engine's individual components carry out specialised tasks to ensure optimised performance, improving image quality and 3D as well as networking and recording functions.

Toshiba's IFA stand will house its Personal-TV concept-- using face recognition to identify users before setting picture and sound to their individual user profile.

Also on show is a slew of 3D displays (either with or without 3D glasses) using both 3D sources and generating 3D content from 2D sources.
