Toshiba announces what it says is the first large-screen glasses-free 3DTV at IFA 2011-- the 55ZL2, a 55" set with a 3D effect viewable from a large viewing angle.

The 55ZL2 divides the viewing area into x9 separate regions, using a number of lenses to redirect two different views in different directions per viewer.

However, the set requires setup before viewing-- face-tracking software detects viewer positions before adjusting the picture accordingly.

It handles resolutions of up to 3840x216, boosting 2D content resolutions using Resolution+ technology.

Toshiba also includes Smart-TV functions, such as the cloud-based Toshiba Places platform and Personal-TV applications.
