

Bjurab Euroscreen, the Swedish projection screen manufacturer with offices also and warehousing at Corby in the UK, launches new products at this year's CEDIA in London. Included is an innovative new screen material called ReAct!

New screen types added to the Bjurab range, will include the company's first tab-tension models. These are electric screens, available in a wide variety of sizes and formats, which have a cable system running down each side of the screen to keep the surface taut and smooth, ideal for high-end and home cinema applications.

All of the above screen types from Bjurab, and many others in their existing range, can now be equipped with the revolutionary new ReAct material. This features a dual coated surface to control ambient light.
