LG rolls out what it says is its smallest portable projector yet-- the HD MiniBeam (model PH300), a projector featuring a durable LED light source and a battery promising up to 2 and a half hours of use.

It beams 1280 x 720 resolution images at 300 ANSI lumens and 100000:1 contrast ratio, in sizes of up to 100-inch. Auto Vertical Keystone (AVK) technology allows for "more convenient" operation by automatically selecting optimal projection angles, while LG says the LED has an estimated lifespan of 30000 hours.

Connectivity options include USB, HDMI and MHL.

"The new LG HD MiniBeam is an ingenious device that can be enjoyed just about anytime and anywhere," LG says. "It allows users to turn any flat surface into a display— both indoors and outdoors-- and immerse themselves in crystal-clear HD quality images. Rendering bright, crisp images measuring an impressive 100 inches diagonal, the LG HD MiniBeam is ideal for both impromptu movie nights and important boardroom presentations."

The HD MiniBeam will be available in select European territories from November 2014.
