

Draper's Larger Optically Seamless TecVision Surfaces

Written by Roger Douglas

Draper shows new, larger sizes for its award-winning **TecVision Engineered Surface Technology** line.

Optically Seamless TecVision screens are now available up to 23 feet (7m) high.

Instead of using traditional seams, or taking the very expensive approach of having a seamless substrate, Draper took a different approach.

“We fused a base substrate which resulted in a flatter base material with a stronger weld,” says AV/Video Marketing Manager Bob Mathes. “With the ideal substrate perfected we could use our TecVision formulation process to create a perfect and optically seamless viewing surface.”

Draper is so confident in Optically Seamless TecVision that if you can see a seam from 5 feet (1.5m) away, the company will take back the surface.
