Seymour-Screen Excellence claims the Enlightor-Neo is the smoothest acoustically transparent film screen, with a thin-fabric pattern so finely woven it is nearly impossible to detect, even from a short distance.

An evolution of the company's Enlightor-4K AT screen, the Neo is more matte, higher gain and promises improved acoustic attenuation. The surface features a newly-woven pattern which improves audio and video performance. Like Enlightor-4K, Neo is rated for 4K and higher resolutions, and delivers enhanced HDR performance.

The matte finish is improved (1.0 gain) while the look is slightly brighter than Enlightor-4K (0.9). It also has more "stretch," meaning it can be pulled tauter than other AT surfaces on the market. This makes it ideal for difficult custom applications such as motorised retractable applications.

Seymour-Screen offers a variety of fixed-frame designs, including magnetic or motorised (single, two- and four-way) masking options, frameless designs and a motorised retractable option.
