Wolf Cinema joins forces with distributor Tau Audio Solutions to demo what it claims is a first at ISE 2019-- a reference home theatre featuring the TXF-3500 UHD/8K resolution home cinema projector and the ProScaler MK6 video processor.

The result is a home theatre system able to produce 8192 x 4320 resolution images from SD, HD and UHD/4K sources. Wolf Cinema says the projected image is incredibly sharp and detailed, but up close it looks more like 35 or 70mm film.

"We premiered this astonishing new ensemble last month, and folks marvelled at the imaging fidelity, detail, colour accuracy and what was described simply as true filmic imaging," the company adds. "The recent leap from HD to 4K was an important step forward in our world, but this reference 8K ensemble presents one of the most realistic images ever cast from all readily available film, video and television sources."
