Projection screen maker Severtson Screens announces plans to showcase the next-generation SAT-4K Acoustically-Transparent projection screen line at CEDIA Expo 2019, held in Denver on 12-14 September 2019.

“Our SAT-4K has received tremendous accolades since its launch, and we are proud to build upon its success with the next generation which features an even finer weave and whiter material that makes the viewing image even better than before,” the company says. “Made in the USA, the SAT-4K replicates the cinema experience in the home and commercial settings like no other projection screen on the market today.”

The next-generation SAT-4K is a seamless projection screen with "virtually" no size limitations. Like the Severtson TAT-4K, it is available as an option for the company's 4K thin/zero bezel fixed frame projection screen solutions. Being acoustically-transparent allows installers to place the entire sound stage behind the screen at the same horizontal axis, allowing the audio to be fully in sync with the on-screen images.

Available in Impression, Deluxe, Deluxe Curved and Thin Bezel configurations, the SAT-4K screen promises optimum video and acoustic performance with "reference quality" digital images. The projection surface offers 1.18 gain and viewing angles of up to 160-degrees, as well as a material both flame and mildew resistant.

The SAT-4K is available now.
