Draper's Clarion and Onyx screen ranges get curved frame versions, which the company launches at InfoComm 2011.

Vel-Tex covers the screens' extruded aluminium frames, which Draper says help offset the pincushion distortion horizontal expansion lenses cause. Curved images are also subject to less reflected ambient light while reflection projector light more accurately.

The company's standard radius comes at 40', while it also offers custom radii.

Curved Onyx screens come in sizes up to 19' wide, and curved Clarion are available in widths up to 13'. Custom sizes are also available.

The screens also include mounting brackets.
