---

When a projection screen is installed in an environment with many windows and too much ambient light, you would wish for a screen surface that could handle that. Now there is Projecta's new **Pearlescent**-- with an increased reflection performance of 1.5 gain-- and developed with this situation in mind.

Pearlescent is a vinyl projection surface for tensioned projection screens like electric tab-tensioned projection screens, fixed frame screens or Projecta Fast-Fold projection screens. Pearlescent has a gain of 1.5 (OK, we already told you that once...) and a full viewing angle of 80°.

Pearlescent's reflective coating provides an increased amount of brightness with a moderately reduced viewing angle. The increased gain of this surface makes it suitable for environments where ambient lighting is uncontrollable and a projector with moderate light output is in use.

A tensioned projection screen surface guarantees a flat viewing area which is absolutely necessary for any installation where a high quality projection is desired. High resolution projectors and short throw lenses increase the necessity of a perfectly flat screen surface.

Projecta has been focusing on tensioned projection screens and screen surfaces for several years so they use special non-supported vinyl materials specifically designed for tensioning.
