AV Systems Performance Verification Standard Review

Written by Bob Snyder

InfoComm is working hard via its volunteer committees to make **one of the most important tools you could ever have…**

To simplify it, let's just call it more than "a checklist," a standards document that your people can use on each project to determine if it was done properly, to control that each step to completion is taken at the right time.

Imagine you go into a project and your project manager has this roadmap. It tells him not only when to turn left but it also tells him his "left-turn blinker" should have been on before he turned.

Truthfully, when you think about it, this is a tool you probably should have built long ago for yourself, for your employees, for your company. It takes advantage of your experiences and makes sure the project manager coming behind you doesn't make the same mistakes.

Where is it written that we always have to learn by our mistakes? You can now take a look at InfoComm's latest draft standard, **10-2013 Audiovisual Systems Performance Verification**. Download the draft and provide your own comments up to Aug. 12th at 5 p.m. EDT.

After that, you can criticize all you want but you had your chance to be a part of AV industry history.

This standard will provide a framework and supporting processes for determining which elements of an audiovisual system need to be verified; the timing of that verification within the project delivery cycle; a process for determining the verification metrics, and the necessary reporting procedures.

We're predicting this will be one of the most valuable standards in InfoComm's arsenal of help for pro AV integrators.
