Control4 boosts its installer technical training resources with Smart Skills-- a set of short videos focusing on various aspects of the Control4 platform.

The videos are around 3 minutes long and demonstrate how to master specific installation configurations, program unique scenes and perform singular tasks using the Control4 platform. While the videos are short, the company says they are designed to extend beyond basic certification courses.

Topics already covered by Smart Skills include how to automate a gas fireplace, integrate a ZigBee door lock, enable alerts to a customer's mobile device and do more advanced programming with custom variables.

"Control4 Training is always looking for better ways to help Control4 certified technicians succeed in their careers. Our dealers depend on us for this," the company says. "Smart Skills are our latest innovation toward that goal. With this new format, we can provide ongoing additions and updates to supplement the standard certification curriculum."

The Smart Skills library is available now for Control4 dealers and their employees.
