# CEDIA Updates Designer Software

Written by Frederick Douglas
05. 11. 2019

The CEDIA Designer (TCD), the cloud-based software helping installers create home cinema or media room design plans, documentation and minutes, releases a host of valuable upgrades.

Upgrades include the ability to generation documentation reports in Spanish, the specification of soundbar products within the tool and a Project Progress feature. Project Progress allows users to demonstrate the phase the project is in, including sales agreed, trim out, first fix and second fix stages.

TCD allows installers to enter in room dimensions and materials, equipment choices and placement, producing a client-ready 30+ page cinema design proposals. It guides users through the design process and the resulting design report is complete in minutes. The latest updates follow the addition of immersive VR render capabilities and the introduction of The Wall, the modular MicroLED 146-inch display from Samsung. Both features are available to TCD users at the Cinema Room Pro tier.

"The new features in The CEDIA Designer showcase our commitment to continuous improvement," TCD creator Guy Singleton says. "The addition of Spanish language documentation, sound bar products, and Project Progress builds on TCD's status as the most powerful cinema design tool around. Integrators deserve software that responds to and evolves with their needs and these upgrades deliver."
