

Danish power company SEAS-NVE selects GreenWave Reality's home energy management solution, and will it to a select number of households before rolling it out to all its customers in 2012.

SEAS-NVE will eventually also extend this solution to include renewable energy sources (such as wind).

GreenWave's solution consists of PowerNodes, intelligent power strips allowing users to control connected devices, together with an in-home energy display through which one can check appliance's consumption while connecting to advanced Gateway.

Customers can also manage their power consumption through internet-connected devices (computers and smartphones).

The solution is expandable, allowing for the monitoring of electric vehicle charging, heat pumps, water and gas meters.
