

Just appointed as the new German distributor, Mega Audio will be showing for the first time a range of Turbosound's loudspeakers on its stand at Prolight+Sound.

At the show will be Turbosound's TCS series sound contracting products, and its Flex Array system in both flown and ground-stacked configurations.

The new TCS series is a complete range of installation products ranging from a large-format double 18" subwoofer and two single 15" arrayable subs, through 12" and 15" active/passive two-way mid-highs to an ultra-compact 6.5" passive model. Turbosound has also developed a high power three-way switchable bi-amp / tri-amp loudspeaker to provide contractors with a full complement of solutions, rounded off with a quality ceiling speaker for background sound applications.

In the TCS series, Dendritic waveguides deliver improved "array-ability" and endless cluster possibilities together with Turbosound voicing. The well-proven Converging Elliptical waveguide also features in the range, with the smooth and even dispersion characteristics ideal for smaller clubs, cafés and restaurants.

The TCS series provides a vast array of useful options – including IP54 weather.
