2N launches the Indoor Touch-- an IP-based access control and door entry system ideal for both residential and commercial applications, designed to make part of an integrated home security and automation system.

Ideal for larger residences and apartment blocks, the 7-inch panel provides an interface for home owners to identify visitors, remotely unlock IP-addressable remote door locks and switch on corridor and stair lighting. It uses an Android-based OS and is compatible with VoIP telephones, other 2N products (including the IP Helios Vario and Verso Door Entry) and 3rd party IP devices.

Power over Ethernet (PoE) keeps cabling to a minimum.

"The great thing about Indoor Touch is that it combines all the installer benefits of access-over-IP, with a chic look that fits seamlessly into corporate and large residential environments," says 2N distributor CIE-Group says. "Also, it is an open system that gives installers the added benefits of integration with 2N's other IP products as well as third party lighting control and heating systems for a wider range of functions and increased specification flexibility."
