Custom installers can now integrate Lilin cameras and NVRs, including its latest 360-degree surveillance camera, with Crestron home control and automation systems via drivers developed by UK-based Janus Technology.

The drivers provide two-way integration with Crestron for all compatible network cameras, as well as one-way control of DVR/NVRs. The result? Full CCTV control functionality complete with pan, tilt and zoom controls, plus MJPEG stream monitoring, on the Crestron panel.

Lilin says Crestron processors can communicate directly with connected cameras and DVR/NVRs, and installers can program motion and tamper variables for user alerts, recording initiation and other appropriate actions within the Crestron system.

The cameras handle the required data crunching for video analytics and de-warping, and the driver provides full PTZ control, save and recall camera positions and alarm/motion monitoring. Meanwhile the DVR/NVR driver provides an easy means for the navigation of on-screen menus for the reviewing of recorded camera footage.

The Crestron-certified driver includes a demonstration panel design for easier integration and testing within an existing system. It is available from the Crestron website.
