Channel Vision announces the availability of its new Network Video Recorder (NVR), the NVR-04N-- one featuring more focused control, reliability video recording and more integration options with existing systems.

It operates in 4-channel mode and allows users to scan recordings for specific times, dates, events, objects, motion or activity. Watchdog monitoring ensures reliable recording so the surveillance system never misses a beat.

The NVR-04N supports ONVIF protocol and features automatic networking-- meaning it automatically locates and adds IP cameras to the network. It handles up to a 5MP IP camera per channel through HDMI, while an RTSP stream input allows the use of 3rd party cameras.
