RTI announces video intercom support for select RTI controllers and 3rd party intercom-enabled devices, a capability ideal for front door access, security gates and room-to-room applications.

Video intercom capabilities are supported on the RTI KX3, KX7 and KX10 in-wall touchpanels, the CX7 and upcoming CX10 countertop/under-cabinet touchpanels, and the flagship T3x, creating the first RTI video intercom-enabled handheld controller. A free firmware update also allows dealers to leverage video communications on compatible devices with H.264-based video intercom support via SIP.

The devices support auto answer and do not disturb modes, while a push-to-talk audio mode lets users communicate via voice only from device to device.

"The demand for intercom continues to increase, and we are pleased to add video functionality across a range of RTI devices," the company says. "Our lineup of video intercom-enabled controllers includes wired and wireless interfaces, which allows our dealers to offer their clients convenient communications between their RTI devices and third-party door stations."
