Environmental monitoring solution provider Sencentric announces what it claims is the most feature-rich wifi sensor for detecting water leaks and freeze conditions-- the SimpleSENCE leak and freeze detector.

According to the company, the SimpleSENCE leak detector is the first line of defense for in-home leak and freeze protection. It is a standalone and self-contained sensor able to operate via wifi, connecting directly to a router without need for a smart home hub or additional subscription. The small design allows optimal placement in any leak prone area, and setup promises to be easy via companion app.

Customer get a choice of text or email (or both) smartphone alerts in case leaks or freezing are detected. In addition, the SimpleSENCE has a loud onboard siren to alert anyone in the house when the smartphone is not close by, not to mention whenever the wifi connection is down. Sencentric says the built-in battery lasts for up to 2 years, and it is paired with a 2-year guarantee.

"We wanted to create a water leak and freeze detector that had all the best features of the leading devices on the market without any of the shortcomings," the company adds. "With wifi operation, longer battery life, and enhanced ergonomic design, we have accomplished our objective. And we've given consumers a product in which they can have complete confidence, to help them avoid the devastating damage that an undetected water leak can cause."

The SimpleSENCE is available now in 1-, 3- or 5-unit packs.
