ELAN claims to raise the bar in home automation with the Intelligent Video Doorbell, a product bringing seamless integration and advanced features adding to the intelligent home experience.

According to ELAN, many video doorbells often require a separate app, and do not fully integrate into home control systems. However, the ELAN Intelligent Video Doorbell offers intelligent features adding peace-of-mind to the main access point of the home. For instance, it integrates motion analytics to accurately report real motion events, eliminating false alerts.

In addition, the doorbell improves security by acting as an ELAN system surveillance camera. As such, the ELAN NVR captures video, and all is controllable through the ELAN app. Fully integrating the doorbell with the control system enables installers to create sequences of automated events, such as turning on lights in case of motion detected during evening and night time hours.

Built-in IntelliVision analytics offer improved mobile notifications and event-based status notifications to further enhance the intelligent home experience. For easy setup, the doorbell auto-discovers and auto-configures into the ELAN system, while the small footprint fits legacy ELAN door station mounting brackets.

The Intelligent Video Doorbell is available in three colours, satin nickel, anodised black and oil-rubbed bronze. Optional surface-mount kits are available in matching finishes.
