

Lutron Intros Blind Control at ISE

Written by Marco Attard
05. 02. 2013

Lutron showcases its latest blind control solution at ISE 2013-- the wireless RadioRa 2 system, controllable via smartphones, tablets and other web-enabled devices.

The solution consists of a wireless Main Repeater enabling open integration with other systems, as well as the internet. RS232 connectivity allows integration with a number of 3rd party systems, while a built-in timeclock handles blind operation at set events throughout the day.

A 2nd ISE 2013 Lutron announcement is a partnership with window decor supplier Coulisse. Customers get a collection of over 700 fabrics and materials for roller blinds and honeycomb blinds as well as a variety of materials for venetian blinds and pleated fabrics.

Also seen at the show are the HomeWorks QS and EcoSystem lighting control systems, together with a variety of ballasts and drivers such as the Hi-lume A-Series driver and the LowPak Relay load controller.
