Savant launches the SmartLighting wifi-based lighting control range-- a solution one can use as either standalone control platform or part of a larger Savant automation system.

Each wifi-connected keypad carries a dimmer, making the solution ideal for both new construction and retrofit applications. Keypads connected to existing line voltage and lighting load wiring become a networked device controllable via Savant iOS app or larger Savant ecosystem.

The double gang keypad features an internal processor, eliminating additional expenses with external hardware and related wiring, and provide access to real-time energy consumption data.

"The elegance, simplicity and versatility of Savant's wifi lighting products make lighting control a viable option for a broad new category of consumers," the company says. "Now the luxury and convenience of sophisticated and scalable lighting control can be achieved by leveraging an existing Wi-Fi network."

The Savant wifi lighting control system and companion iOS lighting control app should be available on October 2013.
