URC launches a Total Control 2-way integration module for Philips Hue wireless lighting allowing URC Total Control products to communicate with the Philips LED app-controlled lightbulbs.

The module is developed by Extra Vegetables and URC. Post-installation users can operate the Hue system with the standard Android and iOS apps, as well as use Total Control interfaces to control Hue devices, create and edit lighting scenes and groups, and add macro commands to recall specific light level, colour or colour temperatures.

The module is also compatible with ccGEN2 interfaces including keypads, the RM-2 remote and ccGEN2-iOS app.

Installers can download the module from the link below.
