Draper presents the FlexShade Recharge at InfoComm 2017-- a quiet, battery-operated shade with rechargeable batteries ideal for flexible installations.

Designed for places such as larger window openings, the FlexShade Recharge features simple installation similar to a manual window shade. The batteries promise to be long lasting and powerful, with no need for an external battery wand. Instead, the roller tube hides the battery, and it is rechargeable via 110V outlet or optional solar panel.

The FlexShade Recharge fits easily into nearly any control scenario-- a touch-sensitive remote or flush-mount wall switch provide quick and simple control, and installers can integrate the Recharge with popular control systems. A mobile device app is also available for shade control and programming, as well as bi-directional communication letting one known when it is time to charge the battery.

In addition Draper offers a variety of accessories, including a maintenance charger, solar panel and cable extenders.
