First introduced at CEDIA 2018, the Flow design ecosystem from Screen Innovation (SI) acts as the missing for dealers wanting to eliminate the guesswork from designing, specifying and ordering SI indoor shades.

Now the company announces the release of Flow V2.0 complete with Zen, the outdoor line of motorised shades featuring Serge Ferrari fabrics with Preconstraint durability technology. The Flow software addresses important variables in outdoor shading, such as mounting, fabric and construction.

When a variable arises (such as seam placement in wide openings) it raises notifications and coaches dealers through precise alignment in adjacent shades. The software also addresses sloped openings, helping dealers resolve issues with customers on measuring day instead of installation day.

"Flow is not just software, it's a complete ecosystem helping dealers select the right fabrics, motors, and controls for every window in the home," SI says. "By combining training, sampling, and software together into a unified experience, we are building dealer confidence in succeeding profitably on every project."
