Savant announces the addition of battery-powered motor solutions as well as quiet, high-powered wired motors to its shading portfolio, both designed to fit in the same low-profile tube and bracketing system.

Ideal for retrofit projects, the rechargeable battery-powered motors are installed in the same JGeiger bracketing system as the wired solutions. They are available with over 400 fabric choices with sheer, translucent and blackout options, allowing installers to sell shades according to design as opposed to technology.

Meanwhile the advanced shading motor options are high-powered but operate very quietly. The motors connect to the Savant low-voltage power enclosure able to easily manage power supplies for both low-voltage keypads and shades.

As well as motor options, Savant offers multiple bracket styles to accommodate the installation. Design-first exposed roller brackets are available in both inside/jamb mount and floating/outside mount styles, and can be ordered in white, black, black aluminium and silver aluminium finishes. The company also offers basic pocket bracket kits for use in both traditional hidden pocket installations or as part of the Savant Negative Reveal Pocket Kits.

The new motor solutions are available now.
