Niko aims to future-proof any type of dimmable lighting installation with the Universal Dimmer Plus-- with support for dimmable energy-saving lamps and LEDs.

It allows both customers and installers to adapt to a changing light bulb market, where incandescent lamps will soon stop being available while energy-saving lamps and LEDs grow further.

The Universal Dimmer Plus dims bulbs ranging from 5-350W, with both phase and reverse phase control-- and one only requires to change dimmer settings according to the light bulb in use.

The modular dimmer is also quite compact, being only 1U wide.

Two models are available-- the 330-00700 (230V push button or 8-24V operation, with brightness level memory settings) and the 330-00701 (0-10V and 1-10V current control operation).
