

Boosting Cooling With Cool-slim

Written by Marco Attard

Active Thermal Management launches Cool-slim-- a slim component cooler designed to boost existing (but insufficient) ventilation for A/V components.

Ideal for overheating problems due to components sitting on closely-spaced shelves, you only need to put it on top of a hot component needing more ventilation.

Uses all-electronic thermal switching circuitry, it pulls hot air out, discharging it to the front and rear, cooling components with and without vent openings in their top covers.

The Cool-slim is only 4cm high-- or 3cm if you remove the feet.
