SnapAV ships the first Binary HDBaseT products-- the B-500-EXT-230-RS and B-500-EXT-330-RS extenders, both able to transmit HD video, audio, and bi-directional IR and RS-232 control signals via single Cat5e/6 cable.

The B-500-EXT-230-RS transmits signals for up to 70m, while the B-500-EXT-330-RS has a transmission range of up to 100m with additional ethernet pass-through.

Both extenders support 4K and 3D video support with PoE (eliminating external power supplies at receiver end) and carry built-in ESD and surge protection.

Installation requires no EDID or EQ settings, making it what SnapAV describes as "a true plug-and-play experience."
