Crestron ships the latest addition to the DM 3.0 product family-- the DM Ultra Cable, a plenum-rated CAT7a shielded twisted cable promising "optimum" 10 gigabit ethernet performance.

According to the company the cable delivers error-free 4K HDMI signals via HDBaseT for up to 100m (regular CAT5e cables only transmit 4K video up to 50m), exceeding HDMI specifications allowing for less than 1 pixel per billion for HDBaseT distribution of 4K content up to 100m.

DM-CONN-20 connectors simplify installation, with no tools or crimping required.

“The infrastructure you choose today will impact your AV systems for years to come,” Crestron says. “Even if you don’t have 4K today, you will soon. And whatever comes next, you know the necessary bandwidths will be even higher. So, you want to make sure you’re using the best cables to handle that. Like our new DMPS3 Series systems, DM Ultra Cable sets the new standard – again. When you have the choice, choose DM Ultra Cable.”

The DM Ultra Cable is available now.
