The launch of the iMac Pro brings about a first Apple-branded Thunderbolt 3 cable with support for 40Gbps data transfers, USB 3.1 gen 2 transfers (up to 10Gbps), DisplayPort video output (HBR3) and charging up to 100W.

The cable is 0.8m long and features an etched Thunderbolt logo to stand up from other cables. It is also ideal for daisy-chaining, with the standard able to handle up to 6 Thunderbolt 3 devices linked with each other.

The iMac Pro has four Thunderbolt/USB-C ports for monitors, external storage and other devices. The AIO PC also has four USB 3 ports, headphone jack, ethernet connection and SDXC card slot.
