

An Epic DIN Cable from Chord Company

Written by Alice Marshall
20. 02. 2020

Chord Company launches a first DIN-terminated cable for the high-performance Epic range, offering a key performance upgrade over the Shawline range DIN while being more affordable compared to the Signature Tuned ARAY Analogue DIN.

Developed by Chord Company engineers, the DIN interconnect construction is different to other analogue interconnects in the Epic range. It takes advantage of performance-enhancing Tuned ARAY geometry, and benefits from wide bandwidth, silver-plated, oxygen-free copper conductors. All conductor pairs also feature multi-tiered foil shielding, a technique the company says reduces interaction between the different signals the DIN cables carry.

The low-noise wide-bandwidth shielding also ensures the maximum benefit is obtained from the latest Naim Audio DR amps and upgrades. In addition, the DIN cable features composite layered PE insulation for the conductor, foiled high-frequency shielding for both signal and ground, with an overall foil shield adding high-frequency signal protection, plus split conductor geometry for impedance matching.

The Epic DIN is available now. All Epic DIN interconnects are hand-built to order, and are available in all common connector combinations including DIN-DIN, DIN to RCA, RCA to DIN and DIN to XLR.
