BMB Electronics announces the availability of Planet Waves universal connectors in Europe-- new RCA, BNC and F connectors eliminating the need stripping and crimping tools for the termination of coax cables.

The connectors fit with standard RG6, RG6 Quad and RG59 coax cables, and have a magnetic tip (holding screws in place), soft grip, an ergonomic shape and a swivel head spinning in the palm of your hand.

Installers need to first cut and remove the coaxial jacket, shield and insulator with the Planet Waves one step strip tool-- leaving the copper conductor exposed in the correct length before inserting it into the connector.

The final step involves tightening the patented screw cutting the jacket while holding the connector securely in place.

Planet Waves says the connection is fully tested for "superior 75 ohm signal transfer," offering speed, efficiency and quality in one connection.
