The TLS HDMI High Speed cable allows for optimum 3D image quality in Full HD over 25m without amplification.

The flame-retardant TLS HDM High Speed cable made in Germany guarantees optimum signal transmission including HDCP for an optimum Full HD 3D image at a resolution of 1080p and at a length of up to 25m WITHOUT active amplification!

According to HDMI specifications, with a Category 2 HDMI cable (High Speed) a transmission length of at least 7.50m can be reached.

Says the maker: "With the currently tested, multiple shielded TLS HDMI High speed cable, even over a transmission length of 25m and without an signal amplifier, an optimum image has been reached without any problems from a Blu-ray-Player on a LCD display device at Full HD 3D and Deep Color up to 1080p (with a frequency up to 340 MHz)."
